SUMMARY

Final-year Computer Science Engineering student with strong hands-on programming fundamentals in C/C++ and Python, built through coursework and applied projects. Experienced in designing modular, multi-system architectures and automation pipelines, with practical exposure to networking concepts, protocol-level data exchange, and traffic analysis tools (Wireshark). Comfortable working with Git-based version control and Agile delivery in fast-paced product environments. Eager to extend this foundation into embedded and automotive software systems (Linux, Android, QNX) as part of vehicle cockpit development and test automation.

EXPERIENCE

Data Analysis Intern

Infosys Springboard

Dec 2025 – Feb 2026 • Digital Learning Platform

Springboard 6.0 – Applied engineering & automation program

- Built **Supportlytics** — a modular automation pipeline that ingests, validates, and tests raw operational data before surfacing results through a live dashboard; applied systematic test-and-validate workflows before each deployment stage.
 - Designed the system in independent, reusable modules (data ingestion, processing, visualisation) — practising modular implementation principles applicable to large embedded/vehicle software systems.
 - Used Git-based version control throughout development, maintaining clean commit history and structured collaboration within an Agile sprint cycle.
 - Performed structured quality checks and regression validation on each pipeline stage, mirroring software testing & automation discipline.
-

Web Development Intern

Raarya Property Developers

Jun 2025 – Jul 2025 • Coimbatore

Full product delivery cycle — build, test, deploy

- Built and tested responsive frontend modules independently before integrating them into the full product, applying modular development practices.
 - Validated functionality and performance across devices and browsers, identifying and resolving defects prior to deployment — direct exposure to manual software testing workflows.
-

Web Development Intern

Nitroware Technologies Pvt. Ltd

Jun 2025

Software development company — full-stack & systems exposure

- Gained hands-on exposure to full-stack architecture, backend APIs, database connectivity, version control (Git), and deployment pipelines.
 - Built foundational understanding of how independent software modules communicate and integrate within a larger product system.
-

EDUCATION

Bachelor of Engineering – Computer Science

Sri Ramakrishna Engineering College

Aug 2023 – May 2027 • Coimbatore

Higher Secondary Certificate (HSC)

Suguna RIP V Matric Hr. Sec School

2021 – 2023 • Coimbatore

SKILLS

PROJECTS

MCP Healthcare Integration System – Multi-Server Network Architecture

[Computer Networks](#) · [Protocol-Level Data Exchange](#) · [Modular System Design](#) · [C/Python](#)

Designed and built a dual-server system integrating DICOM (a binary network protocol for medical imaging devices) with FHIR (a REST-based clinical data protocol) — requiring a practical understanding of client-server communication, protocol-level data exchange, and network reliability under varied conditions. Architected the system into independent, modular components for imaging ingestion, protocol translation, and data delivery, validating consistent behaviour across both communication channels.

Supportlytics – Automated Test & Validation Pipeline

[Python](#) · [Modular Pipeline Design](#) · [Automated Testing](#) · [Data Validation](#) · [Streamlit](#)

Built a fully modular, automated data pipeline — separating ingestion, validation, processing, and visualisation into independently testable components. Implemented systematic data-quality checks at each pipeline stage before final dashboard delivery, applying the same test-before-deploy discipline required in safety-critical software systems. Stack: Python, Pandas, NumPy, Scikit-learn, Streamlit.

Healthscribe – AI Document Processing Tool (Published, IEEE 2025)

[Python](#) · [NLP](#) · [Modular Pipeline](#) · [Output Validation](#) · [Research Publication](#)

Built a modular Python pipeline to extract, process, and validate complex medical terminology using generative AI models, with structured human review at the output validation stage. Demonstrates strong Python fundamentals and disciplined, testable pipeline design. Published at IEEE ICNGCS 2025 (DOI: 10.1109/ICNGCS64900.2025.11183418).

Student Feedback Collection & Automation Tool

[Python](#) · [Tkinter](#) · [Desktop Application](#) · [Modular Implementation](#)

Built a standalone desktop automation tool with clearly separated modules for data collection, processing, and visualisation — replacing a manual process with a reliable, testable software solution.
